

CSE468: Digital Image Processing

Introduction to Matlab & The Image
Processing Toolbox

Disclaimer

- This Slides are based on:
 - The slides of Gowtham Bellala, University of Michigan.
 - Tuo Wang, University of Wisconsin-Madisen.

Introduction

- What is Matlab ?
 - MATLAB is a software package for doing numerical computation. It was originally designed for solving linear algebra type problems using matrices. It's name is derived from MATrix LABoratory.
- Why Matlab and not ***** ?
 1. Images are stored as matrices.
 2. Flexibility.
 3. Documentation.

Matlab Environment

- MATLAB window components:
 - **Workspace**
 - > Displays all the defined variables
 - **Command Window**
 - > To execute commands in the MATLAB environment
 - **Command History**
 - > Displays record of the commands used
 - **File Editor Window**
 - > Define your functions
 - **Current Folder Window**
 - > Indicates the current working directory

Matlab Variable Names

- Variable names are case sensitive
- Variable names must start with a letter and can be followed by letters, digits and underscores.

Examples :

```
>> x = 2;
```

```
>> abc_123 = 0.005;
```

```
>> 1ab_ = 2;
```

Error: Unexpected MATLAB expression

Matlab Special Variables

- pi Value of π
- eps Smallest incremental number
- Inf Infinity
- NaN Not a number e.g. 0/0
- i and j $i = j = \text{square root of } -1$

Matlab Relational Operators

- Matlab supports six relational operators

Less Than

<

Less Than or Equal

<=

Greater Than

>

Greater Than or Equal

>=

Equal To

==

Not Equal To

~= (NOT != like in C)

Matlab Matrices

- MATLAB treats all variables as matrices. For our purposes a matrix can be thought of as an array, in fact, that is how it is stored.
- Vectors are special forms of matrices and contain only one row OR one column.
- Scalars are matrices with only one row AND one column

Generating Matrices

- A scalar can be created in MATLAB as follows:

```
>> x = 23;
```

- A matrix with only one row is called a row vector. A row vector can be created in MATLAB as follows (note the commas):

```
>> y = [12, 10, -3]
```

```
y =  
    12    10    -3
```

- A matrix with only one column is called a column vector. A column vector can be created in MATLAB as follows:

```
>> z = [12; 10; -3]
```

```
z =  
    12  
    10  
    -3
```

Generating Matrices

- A matrix can be created in MATLAB as follows (note the commas and semicolons)

```
>> X = [1, 2, 3; 4, 5, 6; 7, 8, 9]
```

```
X =
```

```
    1    2    3  
    4    5    6  
    7    8    9
```

Matrices must be rectangular!

The Matrix in Matlab

A 5x5 matrix A is shown with row and column indices. The matrix is displayed as follows:

		Columns (n)				
		1	2	3	4	5
Rows (m)	1	4 ¹	10 ⁶	1 ¹¹	6 ¹⁶	2 ²¹
	2	8 ²	1.2 ⁷	9 ¹²	4 ¹⁷	25 ²²
	3	7.2 ³	5 ⁸	7 ¹³	1 ¹⁸	11 ²³
	4	0 ⁴	0.5 ⁹	4 ¹⁴	5 ¹⁹	56 ²⁴
	5	23 ⁵	83 ¹⁰	13 ¹⁵	0 ²⁰	10 ²⁵

The element at row 2, column 4 is highlighted with a blue box and labeled $A(2,4)$. The element at row 3, column 4 is labeled $A(17)$.

- Note: Unlike C, Matlab's indices start from 1

Extracting a Sub-matrix

- A portion of a matrix can be extracted and stored in a smaller matrix by specifying the names of both matrices and the rows and columns to extract. The syntax is:

```
sub_matrix = matrix ( r1 : r2 , c1 : c2 ) ;
```

- Where r1 and r2 specify the beginning and ending rows and c1 and c2 specify the beginning and ending columns to be extracted to make the new matrix.

Extracting a Sub-matrix

- Example :

```
>> X = [1, 2, 3; 4, 5, 6; 7, 8, 9]
```

```
X =
```

```
    1    2    3
    4    5    6
    7    8    9
```

```
>> X22 = X(1:2 , 2:3)
```

```
X22 =
```

```
    2    3
    5    6
```

```
>> X13 = X(3, 1:3)
```

```
X13 =
```

```
    7    8    9
```

```
>> X21 = X(1:2, 1)
```

```
X21 =
```

```
    1
    4
```

Matrix Addition

- Increment all the elements of a matrix by a single value
- Adding two matrices

```
>> x = [1, 2; 3, 4]
```

```
x =  
    1    2  
    3    4
```

```
>> y = x + 5
```

```
y =  
    6    7  
    8    9
```

```
>> xsy = x + y
```

```
xsy =  
     7     9  
    11    13
```

```
>> z = [1, 0.3]
```

```
z =  
     1     0.3
```

```
>> xsz = x + z
```

??? Error using => plus
Matrix dimensions must agree

Matrix Multiplication

- Matrix multiplication

```
>> a = [1, 2; 3, 4]; (2x2)
```

```
>> b = [1, 1]; (1x2)
```

```
>> c = b*a
```

```
c =  
    4    6
```

```
>> c = a*b
```

```
??? Error using ==>  
mtimes Inner matrix  
dimensions  
must agree.
```

- Element wise multiplication

```
>> a = [1, 2; 3, 4];
```

```
>> b = [1, 1/2; 1/3, 1/4];
```

```
>> c = a.*b
```

```
c =  
    1    1  
    1    1
```

Matrix Element wise operations

- ```
>> a = [1,2;1,3];
>> b = [2,2;2,1];
```

- **Element wise division**

```
>> c = a./b
c =
```

```
 0.5 1
 0.5 3
```

- **Element wise multiplication**

```
>> c = a.*b
c =
```

```
 2 4
 2 3
```

- **Element wise power operation**

```
>> c = a.^2
c =
```

```
 1 4
 1 9
```

```
>> c = a.^b
c =
```

```
 1 4
 1 3
```

# Matrix Manipulation Functions

- `zeros` : creates an array of all zeros, Ex: `x = zeros(3,2)`
- `ones` : creates an array of all ones, Ex: `x = ones(2)`
- `size` : returns array dimensions
- `length` : returns length of a vector (row or column)

# Elementary Math Functions

- abs - finds absolute value of all elements in the matrix
- sign - signum function
- sin,cos,... - Trigonometric functions
- asin,acos... - Inverse trigonometric functions
- exp - Exponential
- log,log10 - natural logarithm, logarithm (base 10)
- ceil,floor - round towards +infinity, -infinity respectively
- round - round towards nearest integer
- real,imag - real and imaginary part of a complex matrix
- sort - sort elements in ascending order
- sum,prod - summation and product of elements
- max,min - maximum and minimum of arrays
- mean,median - average and median of arrays
- *and many more...*

# Flow Control

- MATLAB has five flow control statements
  - **if** statements
  - **switch** statements
  - **for** loops
  - **while** loops
  - **break** statements

# 'if' statement

- **Example 1:**

```
>> if i == j
>> a(i,j) = 2;
>> elseif i >= j
>> a(i,j) = 1;
>> else
>> a(i,j) = 0;
>> end
```

- **Example 2:**

```
>> if (attn>0.9) & (grade>60)
>> pass = 1;
>> end
```

# 'for' loop

- Example 1:

```
>> for x = 0:0.05:1
>> printf('%d\n', x);
>> end
```

- Example 2:

```
>> a = zeros(n,m);
>> for i = 1:n
>> for j = 1:m
>> a(i,j) = 1/(i+j);
>> end
>> end
```

# 'while' loop

- Example 1:

```
>> n = 1;
>> y = zeros(1,10);
>> while n <= 10
>> y(n) = 2*n/(n+1);
>> n = n+1;
>> end
```

- Example 2:

```
>> x = 1;
>> while x
>> %execute statements
>> end
```

- Note: In MATLAB '1' is synonymous to TRUE and '0' is synonymous to 'FALSE'

# Scripts and Functions

- M-files are used to write blocks of codes to be executed at once.
- There are two kinds of M-files:
  - Scripts, which do not accept input arguments or return output arguments. They operate on data in the workspace
  - Functions, which can accept input arguments and return output arguments. Internal variables are local to the function

# Functions in Matlab

- Example:

- A file called stat.m:

```
function [mean, stdev]=stat(x)
%STAT Interesting statistics.
n=length(x);
mean=sum(x)/n;
stdev=sqrt(sum((x-mean).^2)/n);
```

- Defines a new function called “**stat**” that calculates the mean and standard deviation of a vector. Function name and file name should be the SAME!

# What is the Image Processing Toolbox?

- The Image Processing Toolbox is a collection of functions that extend the capabilities of the MATLAB's numeric computing environment. The toolbox supports a wide range of image processing operations, including:
  - Geometric operations
  - Neighborhood and block operations
  - Linear filtering and filter design
  - Transforms
  - Image analysis and enhancement
  - Binary image operations
  - Region of interest operations

# Images in Matlab

- Binary images :  $\{0,1\}$
- Intensity images :  $[0,1]$  or `uint8`, `double` etc.
- RGB images :  $m \times n \times 3$
- Multidimensional images:  $m \times n \times p$  ( $p$  is the number of layers)

# Image Import and Export

- Read and write images in Matlab

```
img = imread('apple.jpg');
```

```
dim = size(img);
```

```
imshow(img);
```

```
imwrite(img, 'output.bmp', 'bmp');
```

- Alternatives to `imshow`

```
imagesc(I)
```

```
imshow(I)
```

```
image(I)
```

# Images & Matrices

- **How to build a matrix (or image)?**
- **Intensity Image:**

```
row = 256;
col = 256;
img = zeros(row, col);
img(100:105, :) = 0.5;
img(:, 100:105) = 1;
figure;
imshow(img);
```

# Image Display

- `image` - create and display image object
- `imagesc` - scale and display as image
- `imshow` - display image
- `colorbar` - display colorbar
- `getimage` - get image data from axes
- `truesize` - adjust display size of image
- `zoom` - zoom in and zoom out of 2D plot

# Image Conversion

- `gray2ind` - intensity image to index image
- `im2bw` - image to binary
- `im2double` - image to double precision
- `im2uint8` - image to 8-bit unsigned integers
- `im2uint16` - image to 16-bit unsigned integers
- `ind2gray` - indexed image to intensity image
- `mat2gray` - matrix to intensity image
- `rgb2gray` - RGB image to grayscale
- `rgb2ind` - RGB image to indexed image
