Objectives:

1. Introduce the first law of thermodynamics (energy balance).
2. Mechanisms of energy transfer in open and closed systems.
4. The concept of a pure substance.
5. The physics of phase-change processes.
6. p-\(v\), T-\(v\), and p-T property diagrams.
The first law of thermodynamics, also known as the conservation of energy principle.

Energy Balance

\[
\text{Total energy entering the system} - \text{Total energy leaving the system} = \text{Change in the total energy of the system}
\]

\[
E_{\text{in}} - E_{\text{out}} = \Delta E_{\text{system}}
\]
Energy Change of a System, $\Delta E_{\text{system}}$

Energy change = Energy at final state - Energy at initial state

$$\Delta E_{\text{system}} = E_{\text{final}} - E_{\text{initial}} = E_2 - E_1$$

$$\Delta E_{\text{system}} = \Delta U + \Delta KE + \Delta PE$$

$$\Delta U = m(u_2 - u_1)$$

$$\Delta KE = \frac{1}{2}m(v_2^2 - v_1^2)$$

$$\Delta PE = mg(z_2 - z_1)$$
Energy can only transfer through the system **boundary** in the form of:

- **Heat Transfer**
  - Heat gain \( Q_{in} \)
  - Heat loss \( Q_{out} \)

- **Work Transfer**
  - Work done on the system \( W_{in} \)
  - Work done by the system \( W_{out} \)

- **Mass Transfer**
  - Mass enters the system \( E_{mass,in} \)
  - Mass leaves the system \( E_{mass,out} \)
\[ E_{\text{in}} - E_{\text{out}} = (Q_{\text{in}} - Q_{\text{out}}) + (W_{\text{in}} - W_{\text{out}}) + (E_{\text{mass,in}} - E_{\text{mass,\text{out}}}) \]

where the subscripts “in” and “out” denote quantities that enter and leave the system, respectively. All six quantities on the right side of the equation represent “amounts,” and thus they are positive quantities. The direction of any energy transfer is described by the subscripts “in” and “out”.

Dr. Walid A. Torky
THE FIRST LAW OF THERMODYNAMICS

Energy Balance for closed system

Total energy entering the system - Total energy leaving the system = Change in the total energy of the system

\[ E_{\text{in}} - E_{\text{out}} = \Delta E_{\text{system}} \]

\[ (Q_{\text{in}} - Q_{\text{out}}) + (W_{\text{in}} - W_{\text{out}}) = \Delta U + \Delta KE + \Delta PE \]

For stationary systems:

\[ (Q_{\text{in}} - Q_{\text{out}}) + (W_{\text{in}} - W_{\text{out}}) = \Delta U \]

For stationary and adiabatic systems:

\[ (W_{\text{in}} - W_{\text{out}}) = \Delta U \]

The energy change of a system during a process is equal to the net work and heat transfer between the system and its surroundings.
THE FIRST LAW OF THERMODYNAMICS

Energy Balance for open system

\[ \dot{E}_{\text{in}} - \dot{E}_{\text{out}} = \frac{\text{d}E_{\text{system}}}{\text{d}t} \]

\[ (\dot{Q}_{\text{in}} - \dot{Q}_{\text{out}}) + (\dot{W}_{\text{in}} - \dot{W}_{\text{out}}) + (\dot{E}_{\text{mass,in}} - \dot{E}_{\text{mass,out}}) = 0 \]

Or

\[ \dot{Q}_{\text{in}} + \dot{W}_{\text{in}} + \dot{E}_{\text{mass,in}} = \dot{Q}_{\text{out}} + \dot{W}_{\text{out}} + \dot{E}_{\text{mass,out}} \]

Zero, for steady-state steady-flow process
Example:

A fan that consumes 9 W of electric power when operating. It is claimed to discharge air at a rate of 0.5 kg/s at a discharge velocity of 8 m/s. Determine if this claim is reasonable.

\[
\dot{Q}_{\text{in}} + \dot{W}_{\text{in}} + \dot{E}_{\text{mass, in}} = \dot{Q}_{\text{out}} + \dot{W}_{\text{out}} + \dot{E}_{\text{mass, out}} \\
0 + 9 + 0 = 0 + 0 + \dot{m} \frac{v^2}{2} \\
9 = 0.5 \frac{v^2}{2} \quad \therefore v = 6 \text{ m/s}
\]

Therefore, the claim is false.
For a closed system undergoing a cycle, the initial and final states are identical, and thus, \( \Delta E_{\text{system}} = E_2 - E_1 = 0 \)

Then the energy balance for a cycle simplifies to:

\[
E_{\text{in}} = E_{\text{out}} = 0 \quad \text{Or} \quad E_{\text{in}} = E_{\text{out}}
\]

\[
(Q_{\text{in}} - Q_{\text{out}}) = (W_{\text{in}} - W_{\text{out}})
\]

\[
Q_{\text{net}} = W_{\text{net}}
\]

Similarly, for a open system undergoing a cycle:

\[
\dot{Q}_{\text{net}} = \dot{W}_{\text{net}}
\]
Pump efficiency:

\[ \eta_p = \frac{\text{Net change in power potential of the fluid}}{\text{Mechanical power input}} \]

\[ \eta_p = \frac{\Delta E_{\text{mech}}}{\dot{W}_{\text{shaft}}} = \dot{m} \left[ \frac{p_2 - p_1}{\rho} + \frac{v_2^2 - v_1^2}{2} + g(z_2 - z_1) \right] \]
**THE FIRST LAW OF THERMODYNAMICS**

**Turbine efficiency:**

\[
\eta_t = \frac{\dot{W}_{\text{shaft}}}{\Delta E_{\text{mech}}} = \frac{\text{Mechanical power output}}{\text{Net change in power potential of the fluid}}
\]

\[
\eta_t = \frac{\dot{W}_{\text{shaft}}}{\Delta E_{\text{mech}}} = \frac{m \left( \frac{p_1 - p_2}{\rho} + \frac{v_1^2 - v_2^2}{2} + g(z_1 - z_2) \right)}{m \left( \frac{p_1 - p_2}{\rho} + \frac{v_1^2 - v_2^2}{2} + g(z_1 - z_2) \right)}
\]
1. PURE SUBSTANCE

- A substance that has a fixed chemical composition is called a **pure substance**. Water is a pure substance.

- A mixture of various chemical elements or compounds also qualifies as a **pure substance** as long as the mixture is **homogeneous**.

- **Air gas**, for example, is a mixture of several gases, but it is often considered to be a **pure substance** because it has a uniform chemical composition.
There are three principal phases: solid, liquid, and gas.

Intermolecular bonds are strongest in solids and weakest in gases.

The molecules in a solid are arranged in a three-dimensional pattern (lattice). The mutual attractive forces of molecules are large enough to keep the molecules at fixed positions.

The molecules in the liquid phase are no longer at fixed positions relative to each other and they can rotate and translate freely. In a liquid, the intermolecular forces are weaker relative to solids.
2. PHASES OF A PURE SUBSTANCE

- In the gas phase, the molecules are far apart from each other. Gas molecules move randomly and continuously colliding with each other and the walls of the container. The intermolecular forces are very small, and collisions are the only mode of interaction between the molecules. **Molecules in the gas phase are at a considerably higher energy level than they are in the liquid or solid phases. Therefore, the gas must release a large amount of its energy before it can condense or freeze.**

![Diagram](image_url)

The arrangement of atoms in different phases: (a) molecules are at relatively fixed positions in a solid, (b) groups of molecules move about each other in the liquid phase, and (c) molecules move randomly in the gas phase.
3. PHASE-CHANGE PROCESSES OF A PURE SUBSTANCE

- When two phases of a pure substance coexist in equilibrium, phase-change process occurs.

- **Example: Water-boiling process at the atmospheric pressure:**

Consider a weightless piston–cylinder device containing liquid water at 20°C and 1 atm pressure which is continuously heated to 300°C.
3. PHASE-CHANGE PROCESSES OF A PURE SUBSTANCE

- **State 1**
  Water exists in the **liquid phase**, and it is called a **compressed liquid**, or a **subcooled liquid**. Water is not about to vaporize.

- **State 2**
  Water is about to vaporize at 100ºC. A liquid that is about to vaporize is called a **saturated liquid**.

- **State 3**
  The temperature stops rising. **Saturated liquid and saturated vapor** coexist in equilibrium in the form of **saturated mixture**.
3. PHASE-CHANGE PROCESSES OF A PURE SUBSTANCE

- **State 4**

All the liquid vaporizes and the entire cylinder is filled with saturated vapor that is on the borderline of the liquid phase. The vapor is about to condense.

- **State 5**

Back to a single-phase region again (this time vapor). Further transfer of heat results in an increase in temperature to 300ºC. The vapor that is not about to condense is called superheated vapor.
3. PHASE-CHANGE PROCESSES OF A PURE SUBSTANCE

- **T-\nu diagram for the heating process of water at constant pressure**

   - **STATE 1**: 
     - \(P = 1\) atm 
     - \(T = 20^\circ C\)
   - **STATE 2**: 
     - \(P = 1\) atm 
     - \(T = 100^\circ C\)
   - **STATE 3**: 
     - \(P = 1\) atm 
     - \(T = 100^\circ C\)
   - **STATE 4**: 
     - \(P = 1\) atm 
     - \(T = 100^\circ C\)
   - **STATE 5**: 
     - \(P = 1\) atm 
     - \(T = 300^\circ C\)
3. PHASE-CHANGE PROCESSES OF A PURE SUBSTANCE

- **Saturation temperature**: is the temperature at which a pure substance changes phase.

- **Saturation pressure**: is the pressure at which a pure substance changes phase.

- **Latent heat**: is the amount of energy absorbed or released during a phase-change process.

- **Latent heat of vaporization**: is the energy absorbed during vaporization process and it is equal to the energy released during condensation process.

- **Latent heat of fusion**: is the energy absorbed during melting process and it is equal to the energy released during freezing process.

PROPERTIES OF PURE SUBSTANCES

Thermodynamics – ENGR360/MEP112

Dr. Walid A. Torky
4. PROPERTY DIAGRAMS FOR PHASE-CHANGE PROCESSES

C. $p$-$T$ diagram

The diagram illustrates the phase changes of a pure substance as a function of pressure ($P$) and temperature ($T$). It shows the solid, liquid, and vapor phases, as well as the transitions between them. Key points include:

- **Triple point**: The point where all three phases (solid, liquid, and vapor) coexist in equilibrium.
- **Critical point**: The point beyond which the liquid and vapor phases cannot be distinguished.
- **Melting and vaporization lines**: These represent the processes of melting and vaporization, respectively.

This diagram is a useful tool for understanding the behavior of pure substances under varying pressure and temperature conditions.
